 AB Mutations at the mouse locus encoding microphthalmia-associated
 transcription factor (Mitf) affect the development of many cell types,
 including retinal pigment epithelium (RPE), melanocytes, mast cells, and
 osteoclasts. Here we have identified a novel Mitf isoform, Mitf-a, and
 its human homologue MITF-A by cDNA cloning. MITF-A consists of 520 amino acid
 residues and differs in the amino-terminus from authentic melanocyte-type
 MITF (MITF-M). MITF-A mRNA is widely expressed and represents a
 predominant MITF isoform in cultured RPE cells, whereas MITF-M
 mRNA is exclusively expressed in melanocytes and melanoma cells.
 In situ hybridization analysis suggested that Mitf-a mRNA is enriched in
 the prospective RPE of mouse embryo. Moreover, transient cotransfection
 assays suggested that MITF-A activated transcription of the tyrosinase
 and tyrosinase-related protein I genes. MITF-A/Mitf-a therefore may play an
 important role in melanogenesis in RPE.
